The SST Model GC803 Combustible Gas Sensor is used to determine the concentration of gas accumulated in a protected area and transmit this information to a central point. Located inside a stainless steel flameproof housing, the sensing element is exposed to the detected gas through a sintered stainless steel flame arrestor.

The Model GC803 has been designated with a special "poison-resistant" sensing material, and provides accurate measurements in atmospheres where traces of silicone or other poisoning agents may be present. Readings are unaffected by humidity or carbon dioxide. The concentration of combustible gas is measured in terms of the Lower Explosive Limit (LEL). The detector has a built-in electronic "transmitter," which is installed in the associated explosion-proof junction box. This transmitter converts the signal from the catalytic element to a standard 4-20 mA signal. This signal may be connected to a suitable NOVA-5000/ VulcanGuard module, or to any device with a sourcing 4-20 mA input. The Model GC803 is suitable for the most demanding applications. A large body mass ensures excellent vibration characteristics when used in large machinery applications. Corrosion resistant materials permit use in most environments, including offshore platforms.
